

Lecture 4 Topics

Friday, January 31, 2025 (Week 1, lecture 4) – Chapter 3.

1. Some stars and constellations
2. Kepler's Laws

Constellations

- **Constellation:** Named grouping of stars that often represents a mythological character/creature.
- Various groupings have been proposed by ancient civilizations.
 - Examples: Chinese, Egyptian, Greek, etc.

Constellations

- **Constellation:** Named grouping of stars that often represents a mythological character/creature.
- Various groupings have been proposed by ancient civilizations.
 - Examples: Chinese, Egyptian, Greek, etc.
- Present day astronomers use the Greco-Roman constellations to **divide the sky into 88 sectors.**

Constellations

- **Constellation:** Named grouping of stars that often represents a mythological character/creature.
- Various groupings have been proposed by ancient civilizations.
 - Examples: Chinese, Egyptian, Greek, etc.
- Present day astronomers use the Greco-Roman constellations to **divide the sky into 88 sectors.**
- **Asterism:** Easily recognized part of a constellation.
 - Example: The “**Big Dipper**” is an asterism within Ursa Major.

Constellations

- **Constellation:** Named grouping of stars that often represents a mythological character/creature.
- Various groupings have been proposed by ancient civilizations.
 - Examples: Chinese, Egyptian, Greek, etc.
- Present day astronomers use the Greco-Roman constellations to **divide the sky into 88 sectors.**
- **Asterism:** Easily recognized part of a constellation.
 - Example: The “**Big Dipper**” is an asterism within Ursa Major.

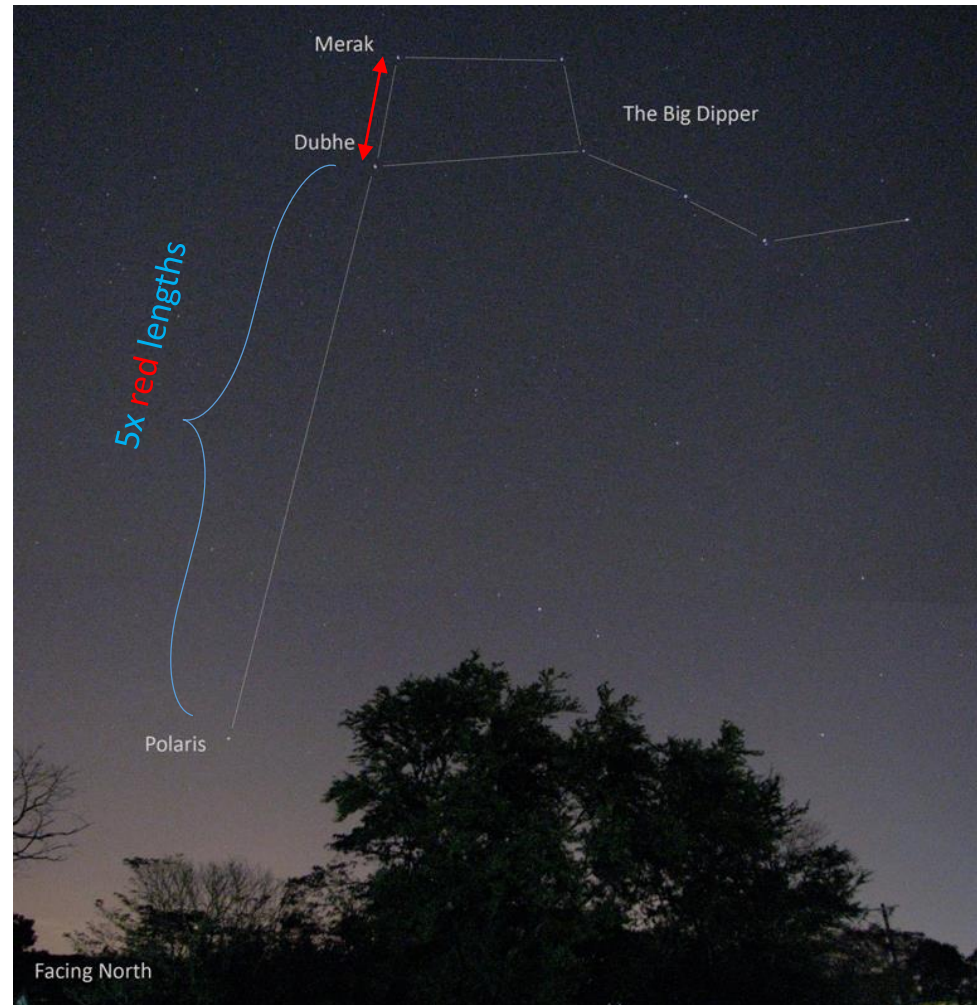

Ursa Major, Big Dipper, Polaris

M31: Andromeda Galaxy

[Source: Facebook/Ted Van]

M31: Andromeda Galaxy

- Nearest large galaxy
- Distance: 2.5 Mly
- Diameter: 220 kly
- Size in sky: $\sim 5^\circ$
- ~ 1 trillion stars

M31: Andromeda Galaxy

- Nearest large galaxy
- Distance: 2.5 Mly
- Diameter: 220 kly
- Size in sky: $\sim 5^\circ$
- ~ 1 trillion stars

5x-10x size of Moon in sky !!!

Kepler's Laws of Planetary Motion

1st Law: The orbits of all planets are **ellipses**.

2nd Law: Law of **equal areas**.

3rd Law: **(orbital period)² = (semimajor axis)³**

[fine print: the “=” depends on units used]

Kepler's 1st Law – Conic Sections

The **circle**, **ellipse**, **parabola**, and **hyperbola** are all formed by the intersection of a plane with a cone.

Note: Unbound orbits can be parabolic or hyperbolic.

Kepler's 1st Law -- Ellipses

- Sun sits at one of the foci.
- Other focus is empty.

$a = \text{semimajor axis}$
Eccentricity = $\varepsilon = \frac{d}{2a}$

Kepler's 2nd Law

The Law of Equal Areas. The orbital speed of a planet traveling around the Sun varies such that in equal intervals of time t , a line between the Sun and a planet sweeps out equal areas (area A = area B).

PolleEv Quiz: PolleEv.com/sethaubin

Kepler's 3rd Law

T = orbital period in units of Earth years

a = semimajor axis in AU

$$T^2 = a^3$$

Kepler's 3rd Law

Example: Martian Orbit

$$T^2 = a^3$$

T = orbital period in units of Earth years

a = semimajor axis in AU

Given $T_{\text{Mars}} = 1.88$ yr,

what is the average distance of **Mars** from the **Sun** ?

Kepler's 3rd Law

Example: Martian Orbit

$$T^2 = a^3$$

T = orbital period in units of Earth years

a = semimajor axis in AU

Given $T_{\text{Mars}} = 1.88$ yr,

what is the average distance of **Mars** from the **Sun** ?

Solution

$$T^2 = a^3 \quad \Leftrightarrow \quad a = \sqrt[3]{T^2} = (T^2)^{\frac{1}{3}} = T^{2/3}$$

Kepler's 3rd Law

Example: Martian Orbit

$$T^2 = a^3$$

T = orbital period in units of Earth years

a = semimajor axis in AU

Given $T_{\text{Mars}} = 1.88$ yr,

what is the average distance of **Mars** from the **Sun** ?

Solution

$$T^2 = a^3 \quad \Leftrightarrow \quad a = \sqrt[3]{T^2} = (T^2)^{\frac{1}{3}} = T^{2/3}$$

$$\Rightarrow a = (1.88)^{2/3} \simeq 1.52 \text{ AU}$$

On average, Mars is $a = 1.52$ AU from the Sun.
