

Today's Topics

Monday, March 17, 2025 (Week 7, lecture 17) – Chapters 18, 19, 22.

A. Luminosity

B. Stellar statistics

C. Luminosity vs mass

D. H-R diagram.

E. Stellar evolution: *Main sequence to red giants.*

Problem Set #6 is available on ExpertTA and is due on Friday, March 21 by 9:00 am

Interlude 1 Essay is due on Friday, March 28 by 9:00 am

Luminosity = Output Power

Stellar luminosity is given by

$$Luminosity = Output Power = Intensity \times Surface Area$$

Luminosity = Output Power

Stellar luminosity is given by

$$Luminosity = Output Power = Intensity \times Surface Area$$

- Light intensity for a blackbody is given by the **Stefan-Boltzmann law:**

$$Intensity = \sigma T^4$$

A hot star is more luminous

Luminosity = Output Power

Stellar luminosity is given by

$$\text{Luminosity} = \text{Output Power} = \text{Intensity} \times \text{Surface Area}$$

- Light intensity for a blackbody is given by the **Stefan-Boltzmann law:**

$$\text{Intensity} = \sigma T^4$$

A hot star is more luminous

- The surface area of a star is related to its radius, i.e. size:

$$\text{Surface Area} = 4\pi R^2$$

A large star is more luminous

Stellar Census → Stellar Statistics

Our Milky Way galaxy has 100-400 billion stars → a statistical analysis of stars is feasible.

Mass-Luminosity Relation

- Luminosity can be determined by the brightness of star (as seen from Earth) and its distance.

→ *Reminder: distance can be measured by **parallax**.*

- How do you determine the mass of a star?

About Half of “Stars” are Binary/Trinary Stars

By Hubble European Space AgencyCredit: Akira Fujii - <http://www.spacetelescope.org/images/heic0206j/> (watermark was cropped), Public Domain, <https://commons.wikimedia.org/w/index.php?curid=5246351>

About Half of “Stars” are Binary/Trinary Stars

[By NASA, ESA, H. Bond (STScI), and M. Barstow (University of Leicester)]

By Hubble European Space Agency Credit: Akira Fujii - <http://www.spacetelescope.org/images/heic0206j/> (watermark was cropped), Public Domain, <https://commons.wikimedia.org/w/index.php?curid=5246351>

How to Determine Stellar Mass ?

- Use binary star systems.
- Use Kepler's 3rd law (Newton's version) to determine $M_1 + M_2$.
- Use observation of center-of-mass to obtain M_1/M_2 .
(or use *Doppler velocimetry*)

Mass-Luminosity Relation

Mass-Luminosity Relation

$$\text{Luminosity} \sim \text{Mass}^{3.9}$$

Temperature-Luminosity Relation

H-R diagram

(Hertzsprung-Russell diagram)

Temperature-Luminosity Relation

H-R diagram

(Hertzsprung-Russell diagram)

*90% of stars are on
"main sequence"*

Temperature-Luminosity Relation

H-R diagram

(Hertzsprung-Russell diagram)

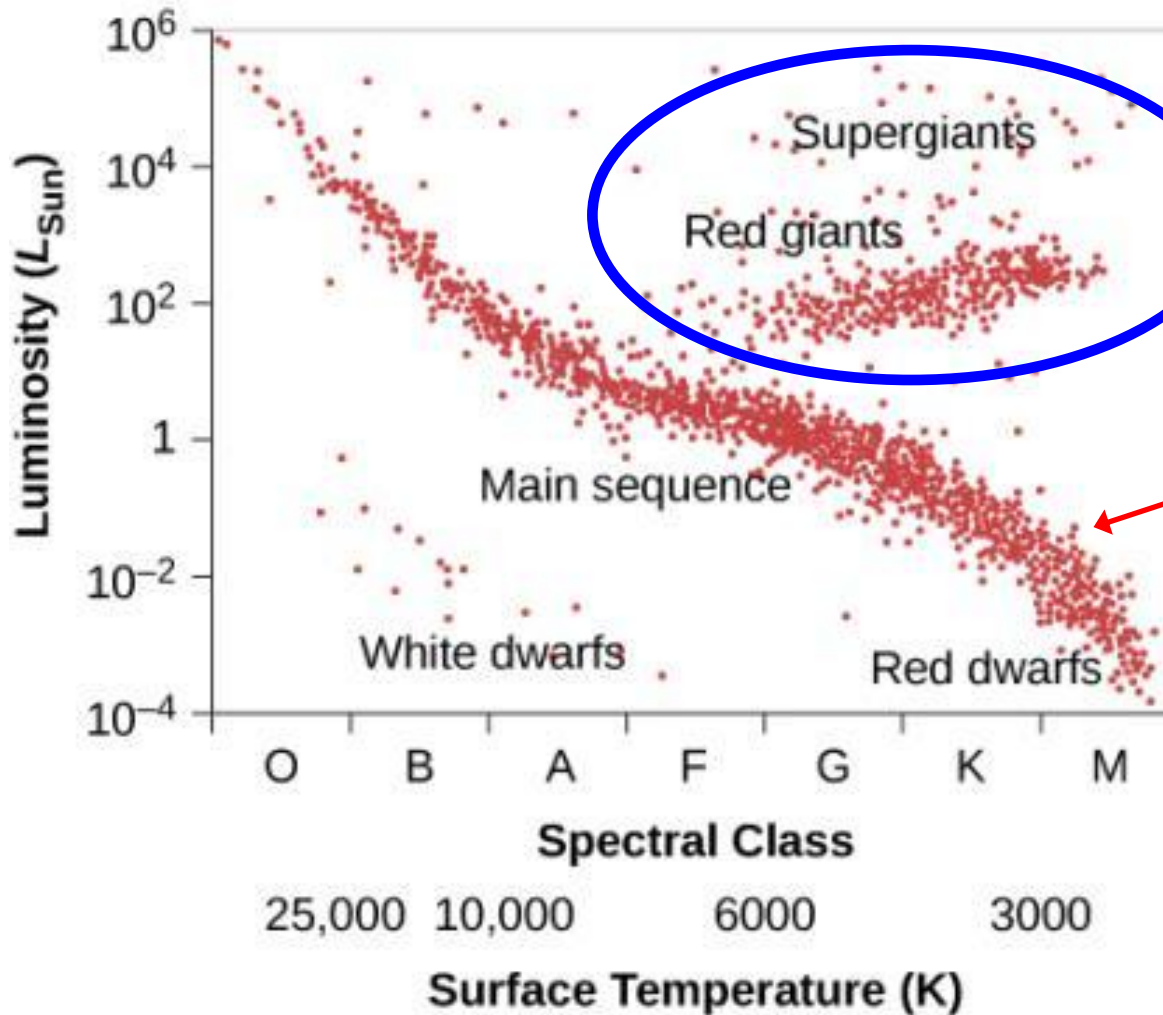

*90% of stars are on
"main sequence"*

*Stars spend about
90% of their "life" on
the main sequence.*

Temperature-Luminosity Relation

H-R diagram

(Hertsprung-Russell diagram)

These stars are in their end stage of "star life."

90% of stars are on "main sequence"

Stars spend about 90% of their "life" on the main sequence.

Temperature-Luminosity Relation

H-R diagram

(Hertzsprung-Russell diagram)

These stars are in their end stage of "star life."

90% of stars are on "main sequence"

Stars spend about 90% of their "life" on the main sequence.

These are stars that have "died."
→ No fusion.

Stellar Evolution: on the H-R Diagram

Stellar Evolution: on the H-R Diagram

Heavy stars

- Blue-ish color.
- Hot and very luminous.
- Very short lived.
→ < 1-10 million years.

Light stars (sun-like & smaller)

- Yellow and red color.
- cooler and dimmer.
- Long lived.
→ > 10 billion years.

Stellar Evolution Summary Table

Spectral Type	Mass (Sun=1)	Radius (Sun=1)	Luminosity (Sun=1)	Temperature	Lifetime (yrs) on main seq.
G0	1.1	1.1	1.4	6,000 K	9 billion

Table based on data in Tables 18.3 & 22.1 (OpenStax: Astronomy)

Stellar Evolution Summary Table

Spectral Type	Mass (Sun=1)	Radius (Sun=1)	Luminosity (Sun=1)	Temperature	Lifetime (yrs) on main seq.
F0	1.7	1.4	5	7,500 K	2.7 billion
G0	1.1	1.1	1.4	6,000 K	9 billion
K0	0.8	0.8	0.35	5,000 K	14 billion

Table based on data in Tables 18.3 & 22.1 (OpenStax: Astronomy)

Stellar Evolution Summary Table

Spectral Type	Mass (Sun=1)	Radius (Sun=1)	Luminosity (Sun=1)	Temperature	Lifetime (yrs) on main seq.
A0	3.3	2.5	55	10,000 K	0.5 billion
F0	1.7	1.4	5	7,500 K	2.7 billion
G0	1.1	1.1	1.4	6,000 K	9 billion
K0	0.8	0.8	0.35	5,000 K	14 billion
M0	0.4	0.6	0.05	3,500 K	200 billion

Table based on data in Tables 18.3 & 22.1 (OpenStax: Astronomy)

Stellar Evolution Summary Table

Spectral Type	Mass (Sun=1)	Radius (Sun=1)	Luminosity (Sun=1)	Temperature	Lifetime (yrs) on main seq.
O5	40	18	700,000	40,000 K	0.001 billion (1 million)
B0	16	7	270,000	28,000 K	0.01 billion (10 million)
A0	3.3	2.5	55	10,000 K	0.5 billion
F0	1.7	1.4	5	7,500 K	2.7 billion
G0	1.1	1.1	1.4	6,000 K	9 billion
K0	0.8	0.8	0.35	5,000 K	14 billion
M0	0.4	0.6	0.05	3,500 K	200 billion

Table based on data in Tables 18.3 & 22.1 (OpenStax: Astronomy)

Stellar Evolution: on the H-R Diagram

Heavy stars

- Blue-ish color.
- Hot and very luminous.
- Very short lived.
→ < 1-10 million years.

Light stars (sun-like & smaller)

- Yellow and red color.
- cooler and dimmer.
- Long lived.
→ > 10 billion years.

Stellar Evolution: on the H-R Diagram

Heavy stars

- Blue-ish color.
- Hot and very luminous.
- Very short lived.
→ < 1-10 million years.

Light stars (sun-like & smaller)

- Yellow and red color.
- cooler and dimmer.
- Long lived.
→ > 10 billion years.

Old age

Stars evolve quickly towards the upper right corner.

→ More luminous, but cooler.

Stellar Evolution: on the H-R Diagram

Heavy stars

- Blue-ish color.
- Hot and very luminous.
- Very short lived.
→ < 1-10 million years.

Light stars (sun-like & smaller)

- Yellow and red color.

→ > 10 billion years.

Old age

Stars evolve quickly towards the upper right corner.

→ More luminous, but cooler.

[OpenStax: Astronomy]

Red Giants & Supergiants

Red Giants

End-of-life stars with masses of
 $0.6-10 M_{\text{Sun}}$.

Red Giants & Supergiants

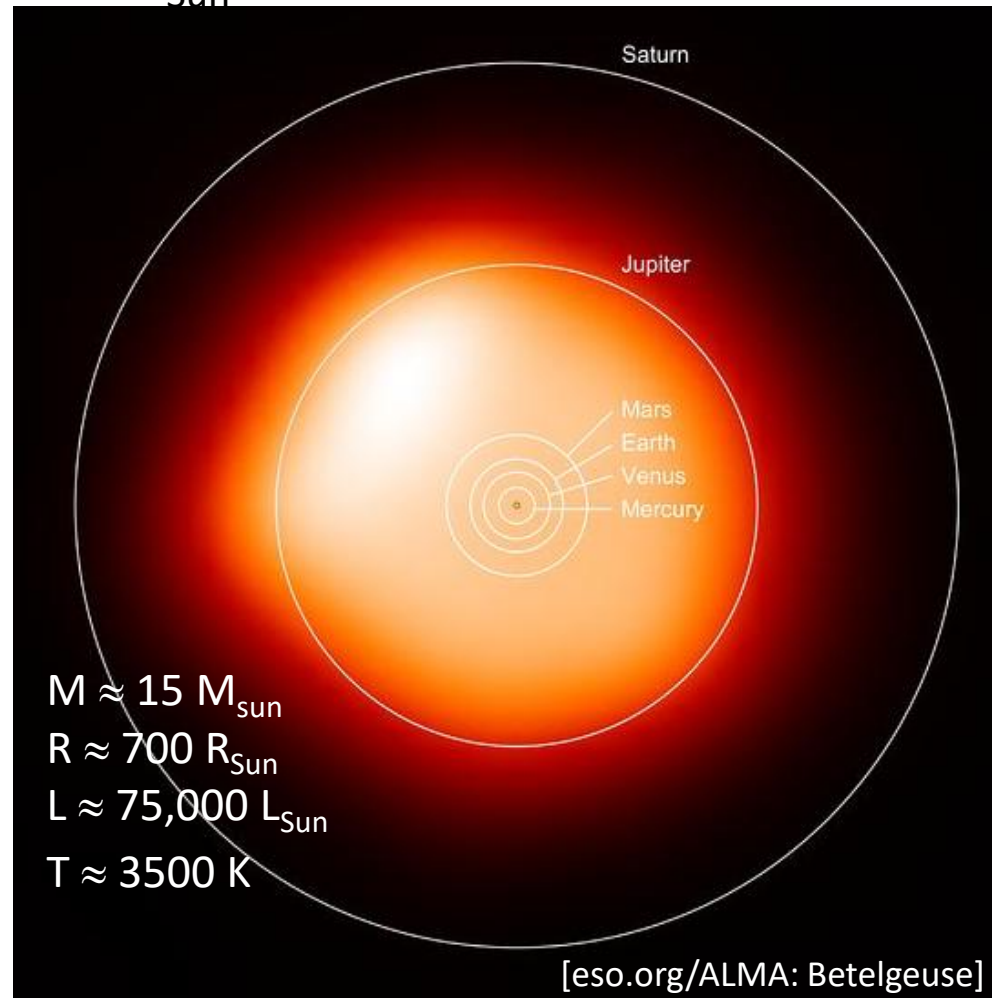

Red Giants

End-of-life stars with masses of $0.6-10 M_{\text{Sun}}$.

Red Supergiants

End-of-life stars with masses of $10-40 M_{\text{Sun}}$.

Aldebaran & Betelgeuse in the Sky
