Example: Estimate the mass of the Milky Way galaxy

$$R = 130 \text{ kly} = 130 \times 10^3 \text{ light years} = 1.22 \times 10^{18} \text{ km}$$

$9.4 \times 10^{12} \text{ km}$

$$= 1.22 \times 10^{21} \text{ m}$$

$$\text{velocity} = v = 300 \text{ km/s} = 300 \times 10^3 \text{ m/s}$$

→ Assume a circular orbit

Method 2: Gravitational Force

$$\text{Force of gravity: } F_g = G \frac{M_{\text{galaxy}} M_{\text{gas}}}{R^2}$$

$$\text{Centripetal force for circular motion: } F_c = \frac{M_{\text{gas}} v^2}{R}$$

$$F_g = F_c \Leftrightarrow G \frac{M_{\text{galaxy}} M_{\text{gas}}}{R^2} = \frac{M_{\text{gas}} v^2}{R}$$

$$\Leftrightarrow M_{\text{galaxy}} = \frac{R v^2}{G} = \frac{(1.22 \times 10^{21}) (300 \times 10^3)^2}{6.6743 \times 10^{-11}}$$

≈ 10 times larger than the previous calculation

$$= 1.645 \times 10^{42} \text{ kg} \quad \left. \begin{array}{l} \div M_{\text{sun}} \\ = 1.99 \times 10^{30} \text{ kg} \end{array} \right\}$$

$$= 8.27 \times 10^{11} M_{\text{sun}}$$

$$\Rightarrow M_{\text{galaxy}} = 827 \text{ billion } M_{\text{sun}}$$
